TABLE OF CONTENTS (1 of 5)

1	GROUPING IN TABLES	Page
1.1	Grouping Basics	7
1.2	Grouping Rows in a Table	8
	<i>Step 1 – Build a Basic Table</i>	8
	<i>Step 2 – Apply Grouping to the Detail Row</i>	8
	<i>Step 3 – Choose Which Field to Group By</i>	9
	<i>The End Result</i>	9
1.3	Removing Groups	10
	<i>Deleting Groups in the Grouping Pane</i>	10
	<i>Deleting Groups in a Table</i>	10
1.4	Formatting a Grouped Table	11
	<i>Adding Group Headers and Footers</i>	11
	<i>Rearranging Group Titles</i>	12
	<i>Adding Group Totals</i>	13
1.5	Multiple Groups	14
	<i>Adding a New Parent Group</i>	14
	<i>Adding a Child Group</i>	14
1.6	Page Breaks	15
	<i>Inserting Page Breaks between Groups</i>	15
1.7	Collapsible Groups	16
	<i>Step 1 - Hiding Detail Rows</i>	16
	<i>Step 2 - Setting Toggle Items</i>	17

2	EXPRESSIONS	Page
2.1	Overview of Expressions	18
	<i>Choosing to Create an Expression</i>	18
	<i>The Expression Builder Dialog Box</i>	19
	<i>Referring to Dataset Fields</i>	19
	<i>Referring to Report Items</i>	20
	<i>Inserting Functions</i>	20
2.2	Ad-Hoc Table Columns	21
	<i>Creating an Ad-Hoc Column Expression</i>	21
2.3	Calculated Fields	22
	<i>Adding a Calculated Field to a Dataset</i>	22
	<i>Using a Calculated Field</i>	23
	<i>Adding Calculated Fields to a Query</i>	23
2.4	Working with Numbers	24
	<i>Basic Arithmetic</i>	24
	<i>Numeric Functions</i>	24
2.5	Conditional Functions	25
	<i>The If Function</i>	25
	<i>The Switch Function</i>	25
	<i>Comparison Operators</i>	26
	<i>Logical Operators</i>	26
2.6	Working with Text	27
	<i>Concatenating Text</i>	27
	<i>Text Functions</i>	27
2.7	Working with Dates	28
	<i>Returning the Current Date</i>	28
	<i>Date Functions</i>	28
	<i>Intervals for Date Functions</i>	29
	<i>Formatting Dates</i>	29
2.8	Aggregating Data	30
	<i>Aggregate Functions</i>	30
	<i>Adding Aggregates the Quick Way</i>	30
	<i>Changing the Aggregate Function</i>	31
	<i>Specifying the Scope</i>	31
2.9	Lookup Functions	32
	<i>The Lookup Function</i>	32
	<i>The LookupSet Function</i>	32
2.10	Built-In Fields	33
	<i>Built-In Fields in the Expression Builder</i>	33
	<i>Built-In Fields in the Report Data Window</i>	33
2.11	Placeholders	34
	<i>Creating a Placeholder</i>	34

TABLE OF CONTENTS (2 of 5)

3	ADVANCED EXPRESSIONS	Page
3.1	Scope	35
	<i>Dataset Scope</i>	35
	<i>Data Region Scope</i>	36
	<i>Row and Group Scope</i>	37
	<i>Entering Aggregate Formulae</i>	37
3.2	Row Numbers	38
	<i>The RowNumber Function</i>	38
	<i>Numbering over Groups</i>	38
	<i>The Nothing Scope</i>	39
	<i>Alternate Row Colouring</i>	39
3.3	Running Totals	40
3.4	Extra Functions	41

4	VARIABLES	Page
4.1	Using Variables	42
	<i>The Need for Variables</i>	42
	<i>Creating a Variable</i>	43
	<i>Referencing Variables</i>	43
4.2	How Variables are Calculated	44
4.3	Group Variables	45
	<i>Creating a Group Variable</i>	45
	<i>Referring to Group Variables in Expressions</i>	46

5	EMBEDDING CODE IN REPORTS	Page
5.1	Overview – Ways to Reuse Code	47
	<i>Our Example</i>	47
	<i>Strategies to Use</i>	47
	<i>Writing your Expression in SQL</i>	48
	<i>Writing an Expression in SSRS</i>	48
5.2	Creating an Embedded Function	49
	<i>Step 1 - Designing your Function (Data Types)</i>	49
	<i>Step 2 – Writing your Function</i>	50
	<i>Step 3 – Embedding your Code in a Report</i>	51
	<i>Step 4 – Referencing your Code</i>	51
5.3	Other Ways to Write Code	52
	<i>Writing Code within RDL</i>	52
	<i>Writing Code within a Class Library</i>	52

6	SQL SERVER DATABASE ACCESS	Page
6.1	Server Explorer / Management Studio	54
	<i>Comparison of SSMS and Server Explorer</i>	54
6.2	Accessing Server Explorer	55
6.3	Accessing Management Studio (SSMS)	56
	<i>Starting to Use Management Studio</i>	56
	<i>Object Explorer</i>	57
	<i>Useful Start-up Options</i>	57

7	VIEWS	Page
7.1	The Need for Views	58
7.2	Creating Views using the Designer	59
	<i>Starting the Designer</i>	59
	<i>Choosing Columns</i>	59
	<i>Sorting and Filtering</i>	60

	<i>Executing a View</i>	61
	<i>Saving and Closing Views</i>	62
	<i>Seeing your View in Object Explorer</i>	62
	<i>Running a View</i>	63
	<i>Changing a View</i>	63
7.3	Scripting Views	64
	<i>Creating a New View</i>	64
	<i>Changing an Open View in Script</i>	65
	<i>Changing a View's Script from Object Explorer</i>	65
7.4	Switching between the Designer and Scripting	66
7.5	Using Views in Datasets	67
7.6	Using Views to Rename Columns	68
7.7	Pros and Cons of Views	69
	<i>Advantages of Views</i>	69
	<i>Disadvantages of Views</i>	69

TABLE OF CONTENTS (3 of 5)

8	PARAMETERS	Page
8.1	Introduction to Parameters	70
	<i>Displaying the Parameters Pane</i>	70
8.2	Report Parameters	71
	<i>Creating a Report Parameter</i>	71
	<i>Using a Report Parameter in a Filter</i>	72
	<i>Parameter Data Types</i>	72
	<i>Dealing with No Rows</i>	73
	<i>Displaying Parameter Values in the Report</i>	73
8.3	Query Parameters	74
	<i>Writing a Query using Parameters</i>	74
8.4	Organising Parameters	75
	<i>Changing the Order of Parameters</i>	75
	<i>Using the Parameters Pane</i>	75
8.5	Default Values	76
	<i>Typing in a Default Value</i>	76
	<i>Calculating Default Values</i>	76
	<i>Getting Default Values from a Dataset</i>	77
8.6	Null Values	78
	<i>Allowing Null Values</i>	78
	<i>Dealing with Nulls in Filters</i>	78
8.7	Drop Down Lists	79
	<i>Manually Entering Available Values</i>	79
	<i>Using a Dataset to Populate a List</i>	80
8.8	Multi-Value Drop Down Lists	81
	<i>Allowing Multiple Values</i>	81
	<i>Using Multiple Values in Filters</i>	81
	<i>Using Multiple Values in Queries</i>	82
	<i>Displaying Multiple Values in a Report</i>	82
8.9	Cascading Drop Down Lists	83
	<i>Creating Cascading Drop Down Lists</i>	83
	<i>Using Cascading Drop Down Lists</i>	85
8.10	Conditional Formatting with Parameters	86
	<i>Parameters in Formatting Expressions</i>	86

9	STORED PROCEDURES	Page
9.1	Introduction to Stored Procedures	87
9.2	Creating Stored Procedures	88
	<i>Typing in a Stored Procedure</i>	88
	<i>Executing the Script to Create your Stored Procedure</i>	88
	<i>Viewing your Stored Procedure</i>	89
	<i>Basing a Report on your Stored Procedure</i>	89
9.3	Altering a Stored Procedure	90
	<i>Altering an Open Stored Procedure</i>	90
	<i>Altering a Procedure in a Database</i>	90
	<i>The Need to Refresh Fields</i>	91
9.4	Executing Stored Procedures	92
	<i>Refreshing your Local Cache</i>	92
	<i>Altering and Executing a Stored Procedure Together</i>	93
	<i>Selecting a Stored Procedure Name to Run It</i>	93
9.5	Renaming and Deleting Stored Procedures	94
	<i>Renaming/Deleting a Procedure with the Menu</i>	94
	<i>Deleting a Procedure in Script</i>	94
	<i>Renaming a Procedure in Script</i>	94
9.6	The Cheat's Stored Procedure	95

TABLE OF CONTENTS (4 of 5)

10	PARAMETERS IN STORED PROCEDURES	Page
10.1	Overview	96
	<i>Syntax of Parameters</i>	96
	<i>Parameters and SSRS Reports</i>	96
10.2	Creating Procedures with Parameters	97
	<i>Step 1 – Specifying the Parameters</i>	97
	<i>Step 2 – Coding the Parameters</i>	97
	<i>Step 3 – Referencing the Parameters</i>	98
	<i>Using Text Wildcards with Parameters</i>	98
10.3	Testing Procedures using Parameters	99
	<i>Passing Values to Parameters in Order</i>	99
	<i>Testing a Procedure using Parameter Names</i>	100

	<i>The Number Formatting</i>	148

CHAPTER 1 - GROUPING IN TABLES

1.1 Grouping Basics

Applying *grouping* to a table allows you to organise the data into discrete sections. This can make it easier to display and print the data.

In a grouped table the detail rows appear in neatly organised sections. In this example we've grouped films by the country in which they were made.

Australia		
Title	Release Date	Run Time
Crocodile Dundee II	25/05/1988	112
Crocodile Dundee	26/09/1986	98
Happy Feet	17/11/2006	108
Mad Max	12/04/1979	93
Mad Max 2	24/12/1981	96
Mad Max Beyond Thunderdome	10/07/1985	107
Mad Max: Fury Road	07/05/2015	120
Total		734

Brazil		
Title	Release Date	Run Time
City of God	30/08/2002	130
Total		130

Canada		
Title	Release Date	Run Time
My Big Fat Greek Wedding	19/04/2002	95
Porky's	16/04/1982	98
Total		193

Australia		
Action		
Title	Release Date	Run Time
Mad Max	12/04/1979	93
Mad Max 2	24/12/1981	96
Mad Max Beyond Thunderdome	10/07/1985	107
Mad Max: Fury Road	07/05/2015	120

Adventure		
Title	Release Date	Run Time
Crocodile Dundee II	25/05/1988	112

Animation		
Title	Release Date	Run Time
Happy Feet	17/11/2006	108

Comedy		
Title	Release Date	Run Time
Crocodile Dundee	26/09/1986	98
Total		734

You can create multiple nested groups too. In this example we've grouped films by country and within each country we've grouped films by genre.

You can even create fancy collapsing and expanding groups to add a little interactivity to your reports.

Australia		
Brazil		
Title	Release Date	Run Time
City of God	30/08/2002	130
Total		130
Canada		

You can also apply groups to columns in a table but this chapter focusses on grouping rows. The **Matrix** report item is a **Table** with pre-defined row and column groups and you'll learn about this in a later chapter.

1.2 Grouping Rows in a Table

There are several steps involved in creating a grouped table, as detailed in this section.

Step 1 – Build a Basic Table

Start by building a basic table containing the fields you want to see for each detail row.

Here we've added three fields to the table. We've deliberately not included the **Country** field as we're going to group by that field in the next step.

Step 2 – Apply Grouping to the Detail Row

You can choose to apply grouping to the detail row in a table using one of several techniques:

- Right-click on the detail row in the table.

a) Select a cell in the table and then right-click on the grey block to the left of the detail row (the one with the three horizontal lines).

b) From the menu select **Add Group | Parent Group...**

- Right-click on the detail row in the **Grouping Pane**.

a) Right-click the **(Details)** item in the **Row Groups** area of the **Grouping Pane**.

b) Select **Add Group | Parent Group...**

- Click and drag a field from the **Report Data** window to the **Grouping Pane**.

Click and drag the relevant field (here we're using the **Country** column) from the **Report Data** window onto the **(Details)** item in the **Grouping Pane**. A blue horizontal line will appear – it's important to release the mouse when the line sits above the **(Details)** item.

Step 3 – Choose Which Field to Group By

If you used the right-click menu to add a group in Step 2 you'll need to complete a dialog box to specify which field you're grouping by.

Tablix group

Group by: [Country]

Show detail data

Add group header

Add group footer

Help OK Cancel

Select the field you want to group by from this drop down list.

You can optionally add a group header and footer by ticking these boxes. This is something you can't do if you used the click and drag method in Step 2. You can see how to add a header and footer to a group manually later in this chapter.

The End Result

When you've finished applying grouping to the table it should look somewhat different:

A new column containing the group field will be added to the left of the table.

The rows which belong to the group will be indicated by the (symbol on the left of the table. In this example we added a group header and footer so the group comprises three rows of the table in design view.

The grouping pane displays a [icon next to group fields. Items which belong to the group are indented to the right below the group item.

When you run the report the group region in the table will be repeated for each item belonging to the group. In this example the group is repeated for each country in the table.

Country	Title	Release Date	Run Time Minu
[Country]	[Title]	[ReleaseDate]	[RunTimeMinut
Australia	Crocodile Dundee II	25/05/1988	112
	Crocodile Dundee	26/09/1986	98
	Happy Feet	17/11/2006	108
	Mad Max	12/04/1979	93
	Mad Max 2	24/12/1981	96
	Mad Max Beyond Thunderdome	10/07/1985	107
	Mad Max: Fury Road	07/05/2015	120
Brazil	City of God	30/08/2002	130

1.3 Removing Groups

You can delete a group along with its associated rows to return your table to its original state.

Deleting Groups in the Grouping Pane

The easiest way to delete a group is from the grouping pane.

a) Right-click on the group item in the grouping pane and choose the **Delete Group** option.

b) You'll see a dialog box prompting you to choose exactly what you want to delete.

Delete Group

Delete group options:

Delete group and related rows and columns

Delete group only

Help OK Cancel

c) Choose **Delete group and related rows and columns** to return the table to its original state.

d) Choosing **Delete group only** removes the group but keeps the group column.

Deleting Groups in a Table

You can also delete a group by right-clicking inside a table.

a) Right-click on the grey block next to a group row, or on any cell in the table that belongs to the group, and choose **Row Group | Delete Group**.

b) You'll be asked to confirm what you want to delete in the same way as described above.

Delete group options:

Delete group and related rows and columns

Delete group only

1.4 Formatting a Grouped Table

The default layout and formatting of a grouped table isn't particularly attractive. You can do several things to alter the default appearance, as explained in this section.

Adding Group Headers and Footers

If you used the click and drag method to create a group, or you just forgot to tick the boxes on the dialog box when you created the group, you can add a header and footer to a group manually.

When you create a group a new column containing the group field will be added to the left of the table. This column is separated from the other columns with a double, dotted, vertical line.

Right-click on a cell in the group to the left of the dotted vertical line and choose **Insert Row | Inside Group – Above** to create a group header. Choose **Below** to add group footer instead.

Country	Title	Release Date	Run Time Minu
[Country]	[Title]	[Release Date]	[RunTimeMinut]

Country	Title	Release Date	Run Time Minu
[Country]	[Title]	[Release Date]	[RunTimeMinut]

Country	Title	Release Date	Run Time Minu
[Country]	[Title]	[Release Date]	[RunTimeMinut]

If you right-click to the right of the dotted line you must choose **Insert Row | Outside Group – Above** to create a group header.

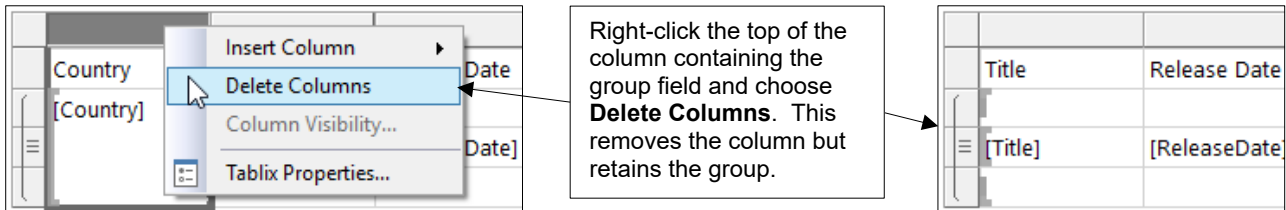

If you had selected **Inside Group** in this case, your new row would appear within the **Details** group. This new row would appear for every row of data in the table, rather than once per group.

Country	Title	Release Date	Run Time Minu
[Country]	[Title]	[Release Date]	[RunTimeMinut]

Rearranging Group Titles

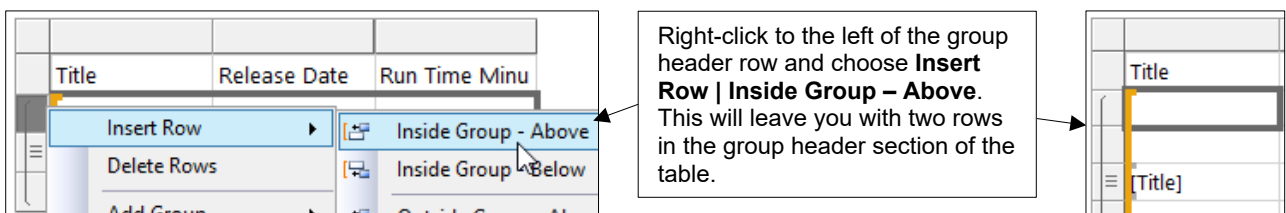

By default the group title appears in a new column to the left of the grouped rows. You may find it looks better to move this title into a row which sits above the group. The steps to do this are:

- 1) Delete the column which contains the group title:

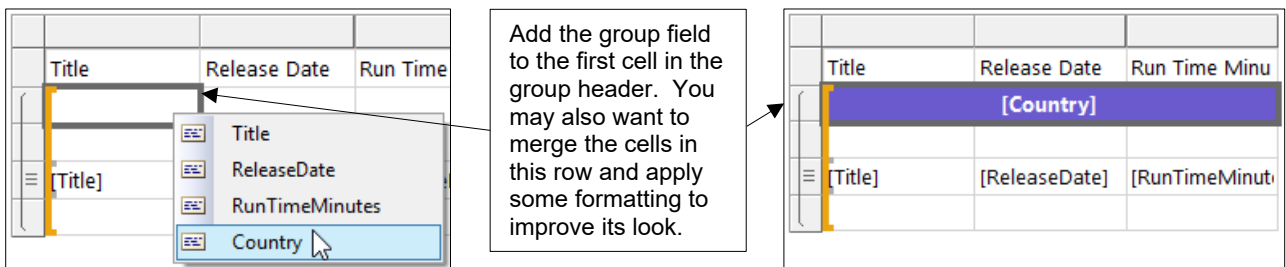

Right-click the top of the column containing the group field and choose **Delete Columns**. This removes the column but retains the group.

- 2) Insert an extra row for the group header:

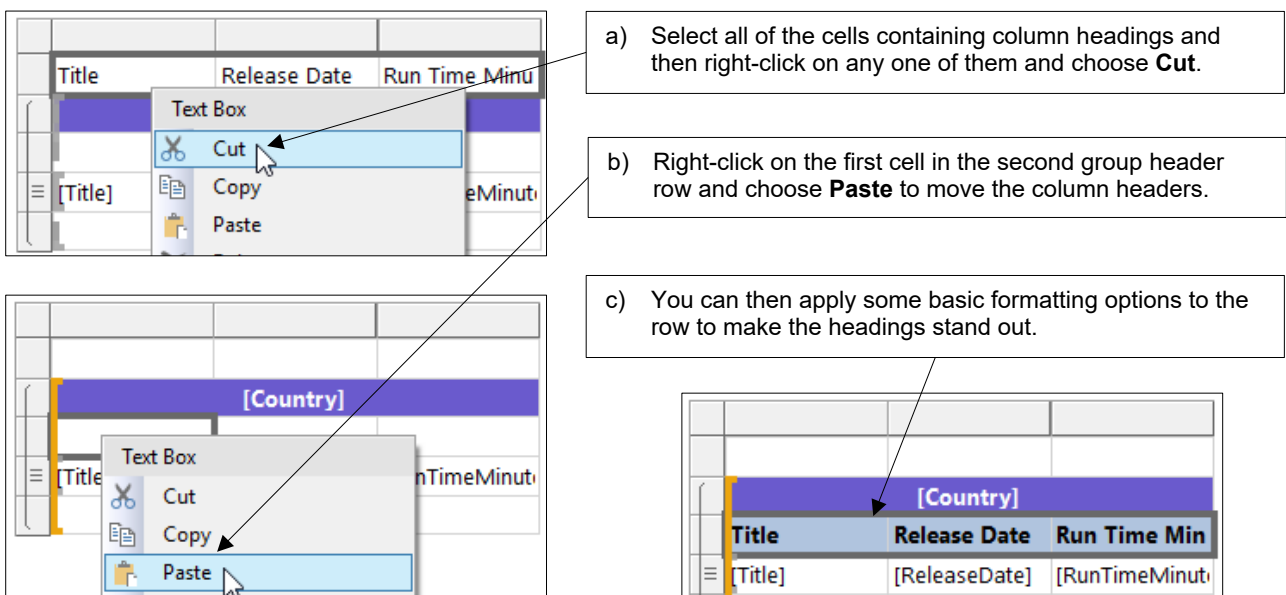

Right-click to the left of the group header row and choose **Insert Row | Inside Group - Above**. This will leave you with two rows in the group header section of the table.

- 3) Assign a field to the group header cell:

Add the group field to the first cell in the group header. You may also want to merge the cells in this row and apply some formatting to improve its look.

- 4) Move the column headings.

- a) Select all of the cells containing column headings and then right-click on any one of them and choose **Cut**.
- b) Right-click on the first cell in the second group header row and choose **Paste** to move the column headings.
- c) You can then apply some basic formatting options to the row to make the headings stand out.

Adding Group Totals

You can add aggregated values to either a header or footer of a group to show totals, averages, etc:

a) Assign a field to a cell in a header or footer row of a group. Here we're adding the **RunTimeMinutes** field to a cell in the footer row.

b) When you add a number field to a group header or footer it will create a sum of that field automatically.

c) The total will appear at the top or bottom of a group when you run the report.

[Country]		
Title	Release Date	Run Time
[Title]	[ReleaseDate]	[RunTimeMinutes]
		[Sum(RunTimeMinutes)]

Run Time	
12	95
12	98
	193

You can change the function applied to the field to create different aggregates.

a) Click on the text in the cell which contains the total expression – it will be highlighted in blue.

b) Right-click on the highlighted text and then select **Summarize By** followed by the function you want to apply to the field. Here we're choosing to show an average of the **RunTimeMinutes** field.

[Country]		
Title	Release Date	Run Time
[Title]	[ReleaseDate]	[RunTimeMinutes]
		[Sum(RunTimeMinutes)]

Run Time	
[RunTimeMinutes]	
[Sum(RunTimeMinutes)]	

You may want to apply some formatting to make the results readable!

[Country]		
Release Date	Run Time	
[ReleaseDate]	[RunTimeMinutes]	[Avg(RunTimeMinutes)]

		104.857142857143

1.5 Multiple Groups

Once you've created one group, adding more is simple!

Adding a New Parent Group

You can add a parent group to an existing group in the same way you added the original group:

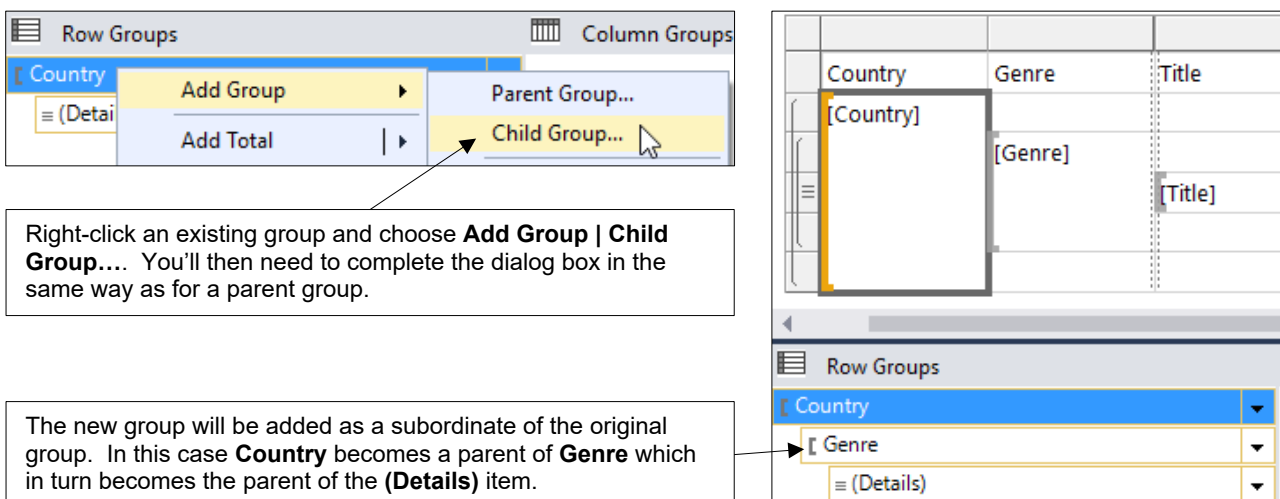

Right-click an existing group in the grouping pane and select **Add Group | Parent Group...** You'll need to complete the dialog box to say which field you want to group by.

Here we're adding a group based on the **Genre** field. This field becomes a parent to the **Country** field, which is itself the parent to the **(Details)** item representing the individual films.

Adding a Child Group

You can add a *child group* to an existing group, as shown in the diagram below:

Right-click an existing group and choose **Add Group | Child Group...** You'll then need to complete the dialog box in the same way as for a parent group.

The new group will be added as a subordinate of the original group. In this case **Country** becomes a parent of **Genre** which in turn becomes the parent of the **(Details)** item.

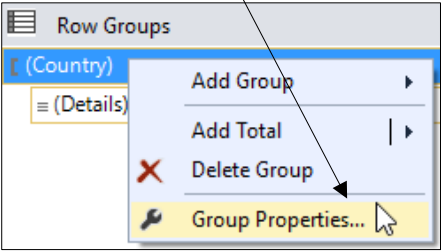

1.6 Page Breaks

You may find it useful to have each group start on a new page, rather than simply following on immediately after the previous group in the table.

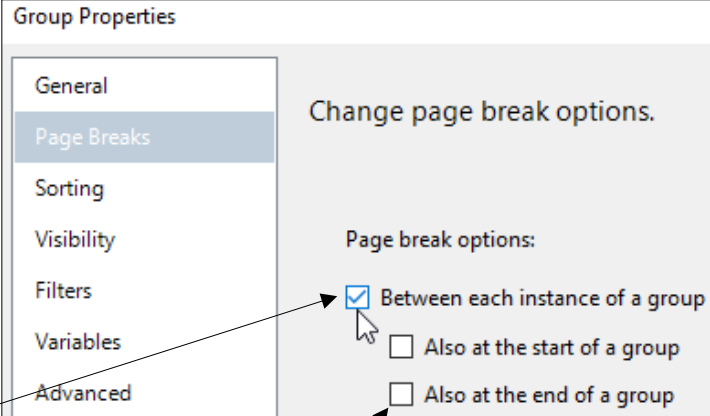

Inserting Page Breaks between Groups

You can add a page break between each group using the **Group Properties** dialog box.

a) Right-click a group and click **Group Properties...**

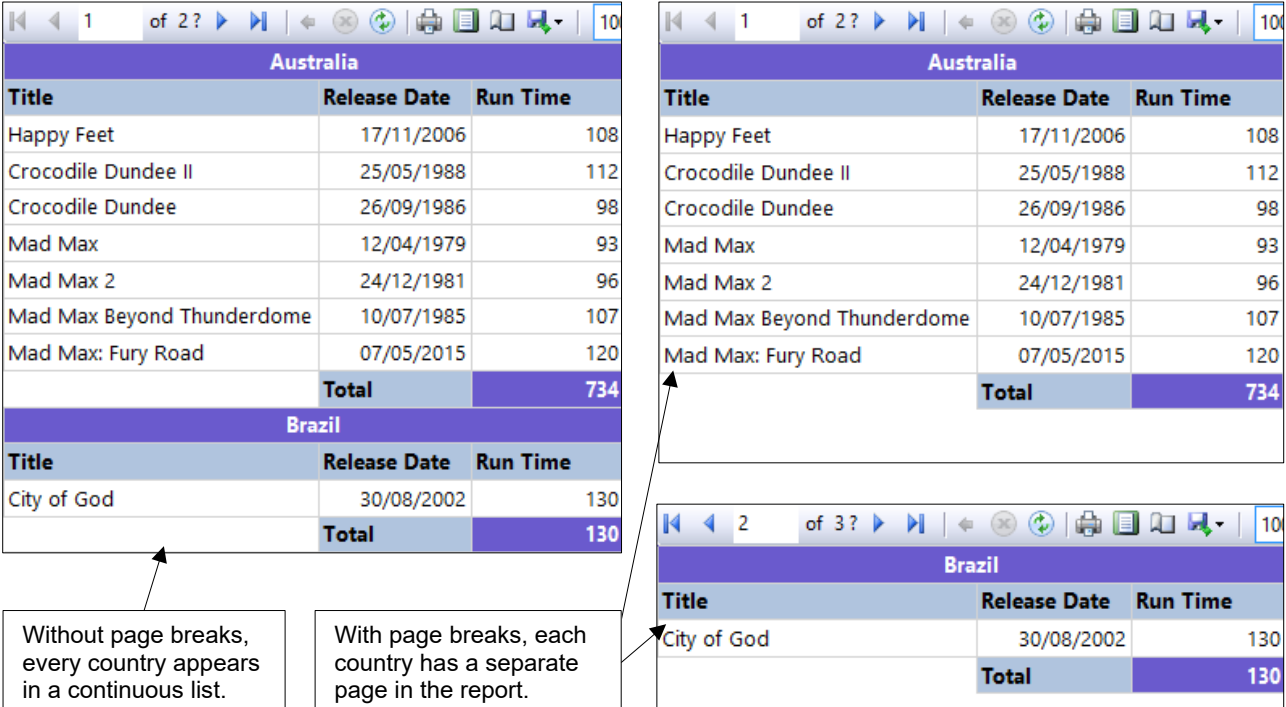

b) On the **Page Breaks** page of the dialog box, tick this box to add a page break between each group.

c) The other options are useful if you have items before or after the table in your report.

You should notice a difference when you run the report:

Without page breaks, every country appears in a continuous list.

With page breaks, each country has a separate page in the report.

Australia

1.7 Collapsible Groups

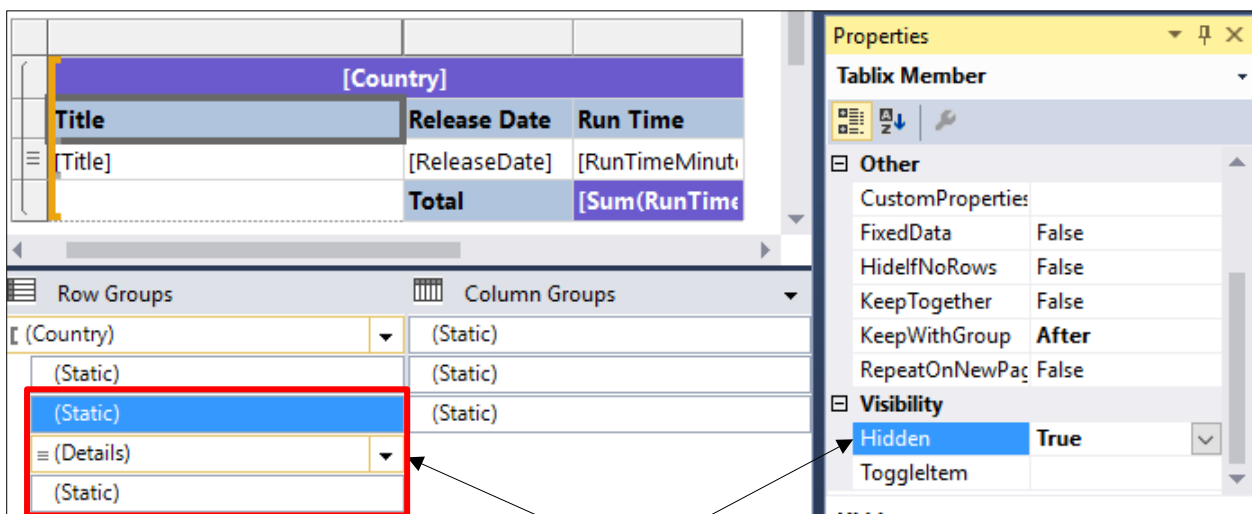

Creating collapsible groups allows you to show and hide the detail rows in a group when the report is running.

Step 1 - Hiding Detail Rows

The first step in creating a collapsible group is to ensure that the detail rows and any associated column headers and footers are hidden when the report loads.

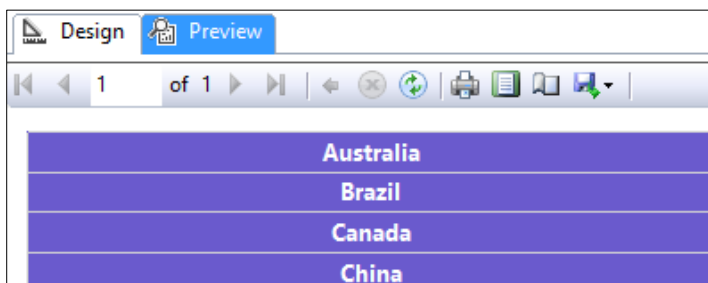

Make sure that the grouping pane is set to **Advanced Mode** by clicking the drop arrow in the top right and clicking here.

Select an item in the Grouping Pane that you want to hide and then change its **Hidden** property to **True** in the **Properties** window. For this example we would hide the **(Details)** item and the **(Static)** item immediately above and below it. You must do this separately for each item that you want to hide.

When you run the report you should only be able to see the items in the table that you didn't hide.

All of the detail rows and the column headers and group footer rows have been hidden.

Step 2 - Setting Toggle Items

The *toggle item* is the report item that you will click on to show and hide the detail rows in each group. The first thing you need to do is find out the name of this item.

When we run the report we'd like to click on the cell containing the country name to show the details for that country. Start by selecting the cell which contains the **Country** field.

In the **Properties** window you'll see the name of the selected item at the top and also next to the **Name** property.

Having established the name of the item you'd like to click on, you can set this object to be a toggle item using the grouping pane and **Properties** window.

Select an item in the grouping pane whose visibility you want to control. You can then assign an item to toggle its visibility using the **ToggleItem** property in the **Properties** window. You need to do this separately for each item whose visibility you want to control. In our example we need to do this for three items.

When you run the report you should find that you can show and hide items in a group by clicking the + and – symbols which appear in the text box containing the country name.

Click a + symbol to expand a collapsed group.

Click a - symbol to collapse an expanded group.

CHAPTER 2 - EXPRESSIONS

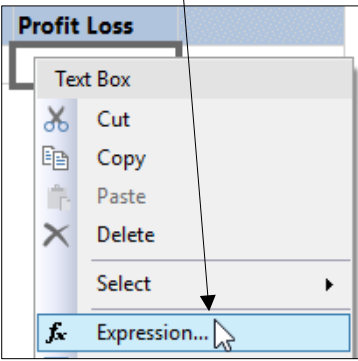

2.1 Overview of Expressions

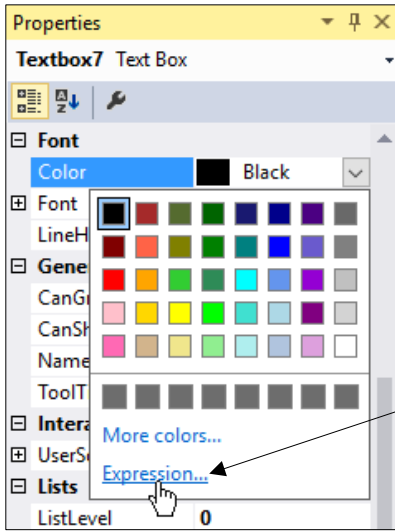

Expressions are calculations that are evaluated when you run a report to determine some aspect of the report. They crop up almost everywhere in SSRS, as this chapter will show you!

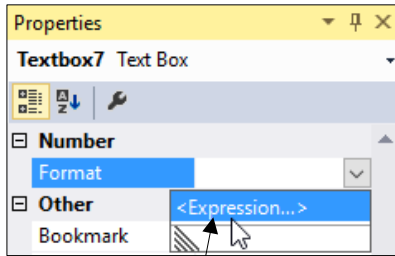

Choosing to Create an Expression

You can add an expression to calculate a value in a variety of places in a report.

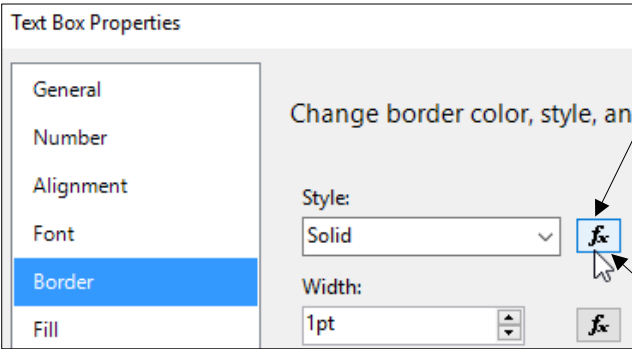

You can add an expression to calculate the value of a text box by right-clicking in it and choosing **Expression...**

You can add an expression to many items in the **Properties** window. To do this, click the drop arrow next to a property and look for an option called **Expression...**

You can also assign expressions to properties in the **Properties** dialog box. To do this, look for properties which have this button next to them.

Click the button to create an expression which will calculate a value for the property.

This chapter explains how to calculate new values which will appear in the report. The next chapter shows how to use expressions to change the appearance of a report.

The Expression Builder Dialog Box

When you choose to create an expression you'll be presented with the *Expression Builder* dialog box. This provides you with help as you create your calculation.

This text provides you with a handy reminder of which property you're creating an expression for.

Use this area to create your expression using a combination of typing and selecting items from the panels in the bottom half of the dialog box.

Use the options in the bottom half of the dialog box to insert items into your expression.

You can double-click on items in these panels to insert, for example, the names of functions and references to fields in a dataset.

Referring to Dataset Fields

Many of your expressions will refer to the value of fields in a dataset. You can insert references to fields easily using the **Expression Builder**.

In the bottom half of the dialog box, click the **Fields** category to see a list of fields in the dataset you're using.

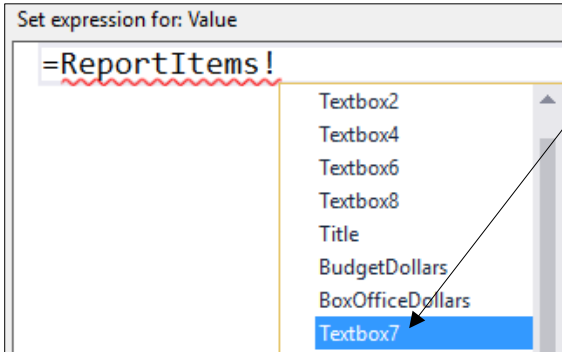

Double-click on a field to insert a reference into your expression. You can also simply type this in.

Referring to Report Items

You'll sometimes need to refer to an item in the report, for example, to return the value of a textbox. The **Expression Builder** doesn't list report items so you'll need to do some typing.

Each item in a report has a name which you'll need to know if you want to refer to it in an expression. You can select the item and look in the **Properties** window to see or change the item's name.

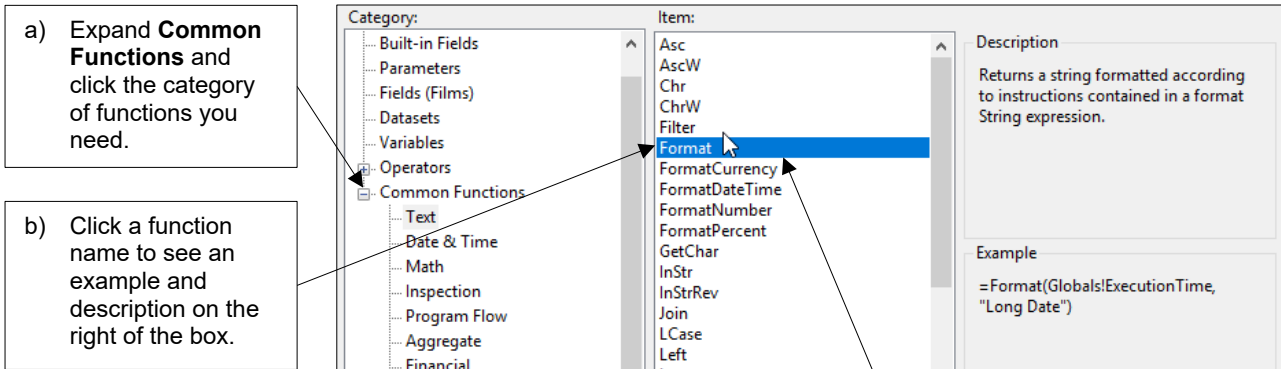

In the **Expression Builder**, type in **=ReportItems!** to see a list of the items in the report. Find the name of the item you want to reference and double-click or highlight it and press **Tab** to insert the name.

To complete the reference, enter a full stop and then refer to a property of the item. In this case it's **Value**.

`=ReportItems!Textbox7.Value`

Inserting Functions

You can use a variety of functions in your expressions. Rather than trying to remember the names of all the available functions, you can use the **Expression Builder** to insert them.

a) Expand **Common Functions** and click the category of functions you need.

b) Click a function name to see an example and description on the right of the box.

c) Double-click a function name to insert it into the expression. A tooltip appears to show you what arguments you must pass into the function's parameters.

d) Fill in the required arguments for the function and complete it by closing the parentheses.

2.2 Ad-Hoc Table Columns

You can use *ad-hoc* expressions to create new calculated columns in a table. The table in the diagram below has two columns whose values are calculated using ad-hoc expressions.

Title	Budget	Box Office	Profit Loss	Band
Jurassic Park	63000000	1029939903	966939903	Profit
Spider-Man	140000000	821708551	681708551	Profit
King Kong	207000000	550500000	343500000	Profit
Superman Returns	204000000	391081192	187081192	Profit
Titanic	200000000	2186772302	1986772302	Profit
Evan Almighty	175000000	173418781	-1581219	Loss

The **Profit Loss** column is calculated by subtracting the value of the **Budget** field from that of the **Box Office** field.

The **Band** column is calculated using an **IIf** function to determine if the value of the **Profit Loss** item is less than **0**.

Creating an Ad-Hoc Column Expression

You can calculate the value of a text box in a table by adding an expression directly to it.

Right-click the text box and choose **Expression...** to open the **Expression Builder**.

Set expression for: Value

```
=Fields!BoxOfficeDollars.Value-Fields!BudgetDollars.Value
```

Build the first expression by subtracting the value of the **BudgetDollars** field from that of the **BoxOfficeDollars** field. The final expression should look like this.

Once you've created the first expression you can create a new column which refers to it. You'll need to know the name of the text box which contains the first expression to do this.

Here we're using an **IIf** function (more on this later in the chapter) to check if the value of the text box containing the first expression has a value of less than **0**.

Set expression for: Value

```
=IIf(ReportItems!Textbox7.Value<0,"Loss","Profit")
```

If the condition is met, the function returns the word **Loss**, otherwise it returns the word **Profit**.

The examples on this page would be more useful as calculated fields, as described in the next section. Ad-hoc column expressions are still useful however, as some functions in SSRS can't be used in a calculated field.

2.3 Calculated Fields

A *calculated field* is an expression which creates a new field in a dataset. You can use calculated fields in the same way as built-in fields to, for instance, sort and filter items in the dataset.

Calculated fields are generally more useful than ad-hoc calculated columns as they're easier to reference in subsequent expressions and you can reuse them in multiple report items.

Adding a Calculated Field to a Dataset

Adding a calculated field takes a little more effort than adding an ad-hoc column expression. Here are the steps you'll need to follow:

- 1) Choose to add a calculated field to a dataset.

- 2) Provide a name for the field and launch the **Expression Builder**.

- 3) Create the expression.

When you've clicked **OK** a couple of times, your new field will appear in the dataset field list.

Calculated fields are listed in the dataset in the same way as other fields.

Using a Calculated Field

Once you've created a calculated field you can use it in the same way as any other field. For example, you can:

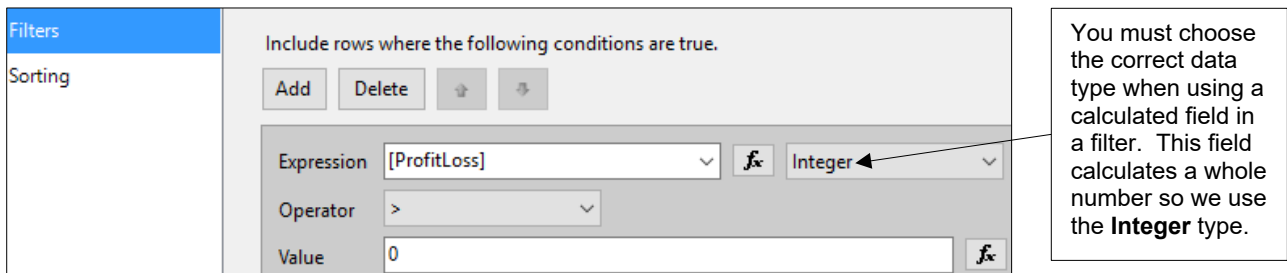

- Add the field to a report item such as a table.

- Apply sorting to a report item.

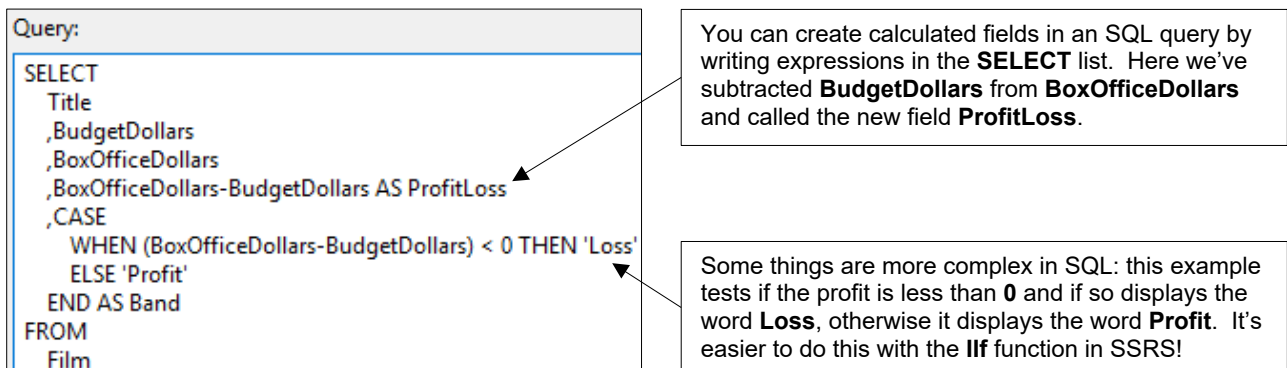

- Apply filtering to a dataset or report item.

Adding Calculated Fields to a Query

If you know how to write SQL you may prefer to add calculated columns to a dataset's query.

2.4 Working with Numbers

Some of the simplest expressions you'll create will involve numbers. This page describes a few of the basic things you can do to manipulate numeric data in SSRS.

Basic Arithmetic

You can perform arithmetic on numbers by placing an *operator* between them. The table below lists the arithmetic operators in SSRS:

Operator	What it does	Example	Result
+	Adds two values together.	$3 + 2$	5
-	Subtracts one number from another	$3 - 2$	1
*	Multiplies two numbers together.	$3 * 2$	6
/	Divides one number by another and returns a decimal number.	$3 / 2$	1.5
\	Divides one number by another and returns a whole number.	$3 \setminus 2$	1
^	Raises one number to the power of another.	$2 ^ 3$	8
Mod	Returns the remainder of dividing one number by another.	$3 \text{ Mod } 2$	1

Numeric Functions

You can use several numeric functions to manipulate numbers in interesting ways. You can see a summary of some useful numeric functions in the table below:

Function	What it returns	Example	Answer
<code>Abs(number)</code>	The absolute value of a number.	<code>Abs(-5)</code>	5
<code>Ceiling(number)</code>	The next largest whole number.	<code>Ceiling(3.147)</code>	4
<code>Floor(number)</code>	The next smallest whole number.	<code>Floor(3.147)</code>	3
<code>Int(number)</code>	The integer portion of a number. For negative numbers it returns the next lowest whole number.	<code>Int(9.81)</code> <code>Int(-9.81)</code>	9 -10
<code>Round(number, [number of decimal places])</code>	A number rounded to a whole number or an optional number of decimal places.	<code>Round(3.147)</code> <code>Round(3.147, 2)</code>	3 3.15
<code>Sqrt(number)</code>	The square root of a number.	<code>Sqrt(16)</code>	4

You'll find all of the functions shown above, along with many others, in the **Math** category of functions in the Expression Builder.

2.5 Conditional Functions

Conditional functions are those which return a different answer depending on the result of evaluating a logical test.

The IIf Function

The *IIf* function allows you to test a condition and provide a different answer depending on whether or not it has been met. The basic syntax of the **IIf** function is:

```
=IIf(Condition_To_Test, Answer_If_True, Answer_If_False)
```

The slightly harsh example below tests whether a film has won any Oscars and, if so, describes it as a **Winner**, otherwise it calls the film a **Loser**.

Title	Oscars	Success
Jurassic Park	3	Winner
Spider-Man	0	Loser
King Kong	3	Winner
Superman Returns	0	Loser

Set expression for: Value
`=IIf(Fields!OscarWins.Value>=1,"Winner","Loser")`

The results of this expression are shown on the right. As we suspected: wearing your underpants outside your trousers does make you a loser.

The Switch Function

The *Switch* function is helpful for testing multiple conditions in the same expression. The basic syntax of the **Switch** function is:

```
=Switch(Condition1, Answer1[, Condition_n, Answer_n])
```

The example below categorises films based on their length in minutes.

Expressions with **Switch** tend to be quite long, so take advantage of the ability to use multiple lines in the Expression Builder.

Conditions are evaluated in the order you write them so, in this case, if a film falls into the **Short** category it can't belong to any of the other categories.

```
=Switch(
  Fields!RunTimeMinutes.Value<100,"Short",
  Fields!RunTimeMinutes.Value<150,"Medium",
  Fields!RunTimeMinutes.Value<200,"Long",
  TRUE,"Epic")
```

If a value fails all of the previous tests it must implicitly have a value greater than or equal to **200**. We could explicitly test for this but it's easier to enter the value **TRUE** (which would be the result of the test anyway).

Comparison Operators

A *comparison operator* is the symbol that you place between the two values you're testing. The table below describes the comparison operators you can use in SSRS.

Operator	Description	Operator	Description
=	Is equal to	<>	Is not equal to
>	Is greater than	<	Is less than
>=	Is greater than or equal to	<=	Is less than or equal to

Logical Operators

A *logical operator* affects the way your conditional tests are evaluated. There are three main logical operators you're likely to encounter in SSRS:

Operator	Description	Example
AND	Combines two logical tests and returns True if both conditions are met.	=IIf(Fields!Profit.Value>0 AND Fields!OscarWins.Value>0, "Success", "Failure")
OR	Combines two logical tests and returns True if either condition is met.	=IIf(Fields!Profit.Value<0 OR Fields!OscarWins.Value=0, "Failure", "Success")
NOT	Returns the opposite of a logical value.	=IIf(NOT(Fields!Profit.Value>0 OR Fields!OscarWins.Value>0), "Disaster", "Success")

2.6 Working with Text

You can manipulate text, or *strings*, in a variety of ways in SSRS. Bear in mind that most string operations in SSRS are case-sensitive.

Concatenating Text

Joining strings together, or *concatenating* them, is one of the more common operations you'll perform with strings.

Set expression for: Value

```
=Fields!FirstName.Value & " " & Fields!FamilyName.Value
```

Use the **&** symbol to join two pieces of text together.

Text Functions

The table below describes some of the useful text functions you'll find in SSRS:

Function	What it returns	Example	Answer
InStr(string1, string2, [compare])	The position of the specified character in the string.	=InStr("Wise Owl", "w")	7
LCase(string)	The lower case version of the string.	=LCase("Wise Owl")	wise owl
Left(string, length)	The specified number of characters from the left of the string.	=Left("Wise Owl", 4)	Wise
Len(string)	The number of characters in the string.	=Len("Wise Owl")	8
LTrim(string)	The string without any leading spaces.	=LTrim(" Wise Owl")	Wise Owl
Mid(string, start, [length])	The specified number of characters from a given starting position in the string.	=Mid("Wise Owl", 6, 3)	Owl
Replace(string, find, replace, [start], [count], [compare])	The string with the specified characters replaced by a new string.	=Replace("Wise Owl", "w", "O", 1, -1, vbTextCompare)	Oise OOI
Right(string, length)	The specified number of characters from the right of the string.	=Right("Wise Owl", 3)	Owl
RTrim(string)	The string without any trailing spaces.	=RTrim("Wise Owl ")	Wise Owl
Trim(string)	A string without leading or trailing spaces.	=Trim(" Wise Owl ")	Wise Owl
UCase(string)	The upper case version of the string.	=UCase("Wise Owl")	WISE OWL

For functions with a **Compare** parameter, you can use **vbBinaryCompare** for case-sensitive searches and **vbTextCompare** to make the search case-insensitive.

2.7 Working with Dates

You can manipulate dates in a variety of ways in SSRS.

Returning the Current Date

Many date expressions rely on knowing what the current date is. The table below describes a few ways to get the current date.

Expression	What it does
=Today()	Returns the current date which is recalculated each time a new page is loaded.
=Now()	Gives the current date and time. This recalculates each time a new page loads.
=Globals!ExecutionTime	Returns the current date and time and is calculated when the report first loads.

Date Functions

You can use a variety of functions to work with dates in your report. The examples in the table below assume that today's date is Monday 19th June 2017.

Function	What it returns	Example	Answer
DateAdd(<i>interval</i> , <i>number</i> , <i>date</i>)	A date to which a specified time interval has been added.	=DateAdd("d", 30, Today())	6/19/2017
DateDiff(<i>interval</i> , <i>date1</i> , <i>date2</i>)	The number of specified intervals between two dates.	=DateDiff("d", Today(), #12/25/2017#)	189
DateSerial(<i>year</i> , <i>month</i> , <i>day</i>)	A complete date from the three separate values.	=DateSerial(2017, 7, 16)	7/16/2017
DateValue(<i>date</i>)	A date value based on the provided date, which is usually a string.	=DateValue("18 July 2017")	7/18/2017
Day(<i>date</i>)	The day of the month of the date.	=Day(Today())	19
Month(<i>date</i>)	The month number of the date.	=Month(Today())	7
MonthName(<i>number</i>)	The name of the numbered month.	=MonthName(6)	June
Weekday(<i>date</i> , [<i>firstdayofweek</i>])	The number of the day of the week.	=Weekday(Today(), vbSunday)	2
WeekdayName(<i>number</i> , [<i>abbreviate</i>], [<i>firstdayofweek</i>])	The name of the numbered weekday.	=WeekdayName(2, False, vbSunday)	Monday
Year(<i>date</i>)	The year of the provided date.	=Year(Today())	2017

Intervals for Date Functions

Several of the date functions have an **Interval** parameter. The table below lists the string values you can pass as arguments to this parameter:

Interval	Description	Interval	Description
"yyyy"	Year	"w"	Weekday
"q"	Quarter	"ww"	Week
"m"	Month	"h"	Hour
"y"	Day of year	"n"	Minute
"d"	Day of month	"s"	Second

Rather than passing a string to the **Interval** parameter, you can use one of the **DateInterval** constants.

```
=DateDiff(
  ▲ 1 of 2 ▼ DateDiff(Interval as DateInterval, Date1 as D
```

If a function asks for **Interval as DateInterval** you can type **DateInterval** followed by a full stop to see a list of time units that you can use.

```
=DateDiff(DateInterval.
  Year
  Quarter
  Month
```

You can use one of the intervals by double-clicking it in the list or using the cursor keys to highlight it and pressing **Tab**.

Formatting Dates

You can use functions to calculate a formatted version of your date values. There are two functions that can help you with this, as shown in the table below:

Function	Example	Result
Format(value, [format], [firstdayofweek], [firstweekofyear])	Format(Today(), "dddd, d MMMM yyyy")	Monday, 19 June 2017
FormatDateTime(date, [namedformat])	FormatDateTime(Today(), DateFormat.LongDate)	19 June 2017

There are several named formats that you can use with the **FormatDateTime** function:

```
=FormatDateTime(Today(),DateFormat.
  GeneralDate
  LongDate
  ShortDate
  LongTime
  ShortTime
```

To see a list of formats type **DateFormat** followed by a full stop.

```
ShortDate
```

You can then select one of the valid formats from the list that appears.

2.8 Aggregating Data

An *aggregate* function is one which usually operates on several rows of data rather than just one. You'll commonly find these functions used in table group footers, matrices and charts.

Aggregate Functions

You can see a list of some common aggregate functions in the table below:

Function	What it returns	Example
Sum(Field)	The total of a numeric field.	=Sum(Fields!OscarWins.Value)
Avg(Field)	The average of a numeric field.	=Avg(Fields!RunTimeMinutes.Value)
Min(Field)	The lowest value of a field.	=Min(Fields!BudgetDollars.Value)
Max(Field)	The highest value of a field.	=Max(Fields!BoxOfficeDollars.Value)
Count(Field)	The number of non-null values in a field.	=Count(Fields!FilmID.Value)

You'll find these functions, along with several others, in the **Aggregate** category of the **Common Functions** list in the **Expression Builder**.

You can double-click on a function name to insert it into the expression. You can then reference a field in the dataset to finish the formula.

Set expression for: Value
 =Sum(Fields!RunTimeMinutes.Value)

Adding Aggregates the Quick Way

You can quickly add an aggregate function to a tablix report item by adding a field to cell which doesn't belong to a **Detail** row.

This table has a header and footer row and contains a single group which also has a header and footer.

You can add an aggregate to a non-detail textbox by selecting a field from the field selector tool.

Here we're choosing the **RunTimeMinutes** field in the footer of the group in the table.

This automatically adds a **Sum** function to the footer of the group and of the table.

Changing the Aggregate Function

When you add an aggregate using the quick technique shown on the previous page, SSRS automatically applies the **Sum** function if you choose a numeric field. You can easily change this:

	Title	Minutes	Oscar Wins
	[Title]	[RunTimeMinutes]	[OscarWins]
		[Sum(RunTimeMinutes)]	

a) Click on the text in the cell to select it.

	Title	Minutes	Oscar Wins
	[Title]	[RunTimeMinutes]	[OscarWins]
		[Sum(RunTimeMinutes)]	

b) Right-click on the selected text and choose **Summarize By**, followed by the function you want to use.

Specifying the Scope

The range of rows that an aggregate function operates on is referred to as the *scope*. The scope is applied automatically based on where the aggregate function is placed.

Director	Title	Minutes
[Director]	[Title]	[RunTimeMinutes]
		[Sum(RunTimeMinutes)]
Total		[Sum(RunTimeMinutes)]

Zhang Yimou		
	Hero	99
	House of Flying Daggers	119
		218
Total		143583

Set expression for: Value
`=Sum(Fields!RunTimeMinutes.Value)`

These two text boxes contain the same expression but give different results because of their implicit scopes.

You can alter the scope by passing the name of a data region to an aggregate function. A data region name can be the name of a dataset, tablix report item or group.

Zhang Yimou		
	Hero	99
	House of Flying Daggers	119
		143583
Total		143583

Set expression for: Value
`=Sum(Fields!RunTimeMinutes.Value, "Tablix1")`

In this example we've changed the expression in the group footer so that its scope refers to the entire table.

Set expression for: Value
`=Sum(Fields!RunTimeMinutes.Value) / Sum(Fields!RunTimeMinutes.Value, "Tablix1")`

	0.15%
	143583

Here we've divided the total **RunTimeMinutes** for the group by the total for the table to calculate the proportion of the total run time made up by each director.

2.9 Lookup Functions

SSRS has two *lookup* functions which allow you to match rows in different datasets. This is useful when the datasets use different data sources and couldn't be joined in a single dataset.

Datasets

- └─ **Films**
 - Title
 - ReleaseDate
 - DirectorID
- └─ **Directors**
 - DirectorID
 - FullName

Title	ReleaseDate	DirectorID
Raiders of the Lost Ark	1981-06-12 00:00:00.000	4
Star Wars: Episode IV: A New Hope	1977-05-25 00:00:00.000	7
E.T.: The Extra-Terrestrial	1982-06-11 00:00:00.000	4
Fargo	1996-03-08 00:00:00.000	5

DirectorID	FullName
4	Steven Spielberg
5	Joel Coen
6	Ethan Coen
7	George Lucas

The examples on this page use two separate datasets. The **Films** dataset contains the ID number of each film's director. The name of the director is held in the **Directors** dataset.

The Lookup Function

You can use the **Lookup** function to return a single match for the item you're looking up. In the example below we're attempting to return the name of the single director for each film.

Title	Release Date	
[Title]	[ReleaseDate]	«Expr»

You can't use the **Lookup** function in a calculated field so you must use an ad-hoc expression.

```
=Lookup(
  Fields!DirectorID.Value, 'value to lookup
  Fields!DirectorID.Value, 'field to look in
  Fields!FullName.Value, 'field to return
  "Directors") 'lookup dataset name
```

The results are shown below:

Title	Release Date	
Jurassic Park	11/06/1993	Steven Spielberg
Spider-Man	03/05/2002	Sam Raimi

The LookupSet Function

The **LookupSet** function is very similar to the **Lookup** function except that it returns multiple values. In the example below we're returning all of the films made by each director.

Full Name	
Adam McKay	Talladega Nights: The Ballad of Ricky Bobby Anchorman: The Legend of Ron Burgundy
Adrian Lyne	Indecent Proposal Fatal Attraction Flashdance
Akira Kurosawa	Seven Samurai Kagemusha Ran Rashomon Ikiru Throne of Blood The Hidden Fortress Yojimbo Sanjuro

The second column has an ad-hoc expression to return the list of films.

We use the **Join** function to concatenate the film names returned into a single string.

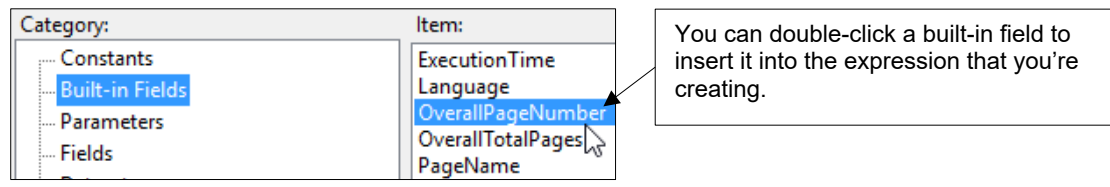

```
=Join(
  LookupSet(
    Fields!DirectorID.Value,
    Fields!DirectorID.Value,
    Fields!Title.Value,
    "Films"),
  vbNewLine)
```

2.10 Built-In Fields

Reporting Services provides you with a set of global values referred to as *built-in* fields. You can use these to create expressions in your reports.

Built-In Fields in the Expression Builder

You can find a category containing the built-in fields in the **Expression Builder**.

Category:

- Constants
- Built-in Fields**
- Parameters
- Fields

Item:

- ExecutionTime
- Language
- OverallPageNumber**
- OverallTotalPages
- PageName

You can double-click a built-in field to insert it into the expression that you're creating.

Set expression for: Value

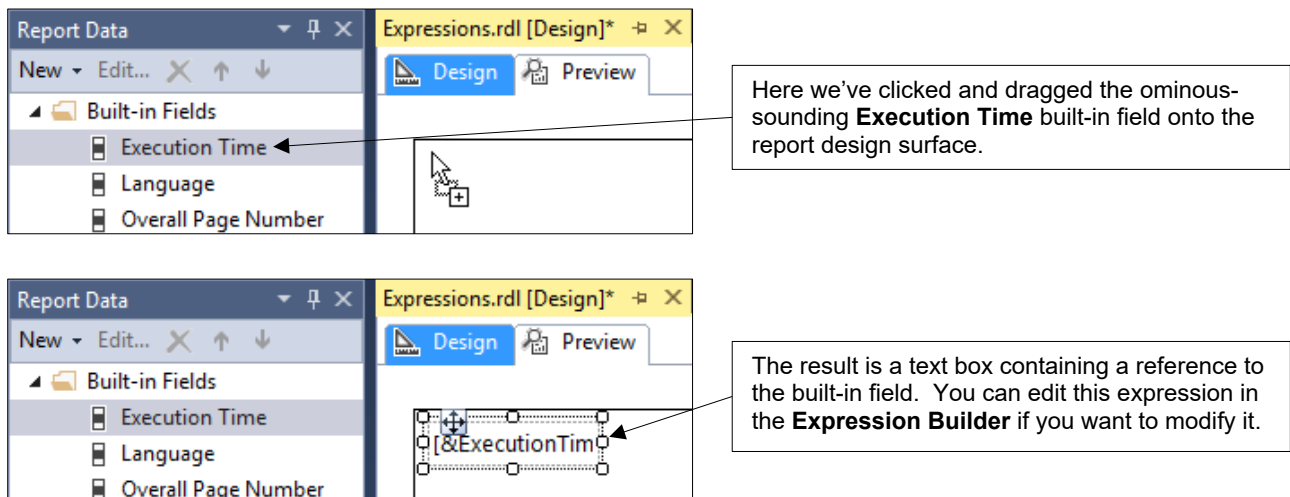

```
= "Page " & Globals!OverallPageNumber & " of " & Globals!OverallTotalPages
```

Page 1 of 45

This expression concatenates two built-in fields with some extra text to create some useful information in the page header.

Built-In Fields in the Report Data Window

You can drag built-in fields from the **Report Data** window in much the same way as dragging dataset fields.

Report Data

- New ▾ Edit... ✕ ↑ ↓
- ▲ Built-in Fields
 - ☞ Execution Time
 - ☞ Language
 - ☞ Overall Page Number

Expressions.rdl [Design]*

Design Preview

Here we've clicked and dragged the ominous-sounding **Execution Time** built-in field onto the report design surface.

Report Data

- New ▾ Edit... ✕ ↑ ↓
- ▲ Built-in Fields
 - ☞ Execution Time
 - ☞ Language
 - ☞ Overall Page Number

Expressions.rdl [Design]*

Design Preview

The result is a text box containing a reference to the built-in field. You can edit this expression in the **Expression Builder** if you want to modify it.

2.11 Placeholders

As an alternative to concatenating long, complex expressions, you can use a *placeholder* to make life easier.

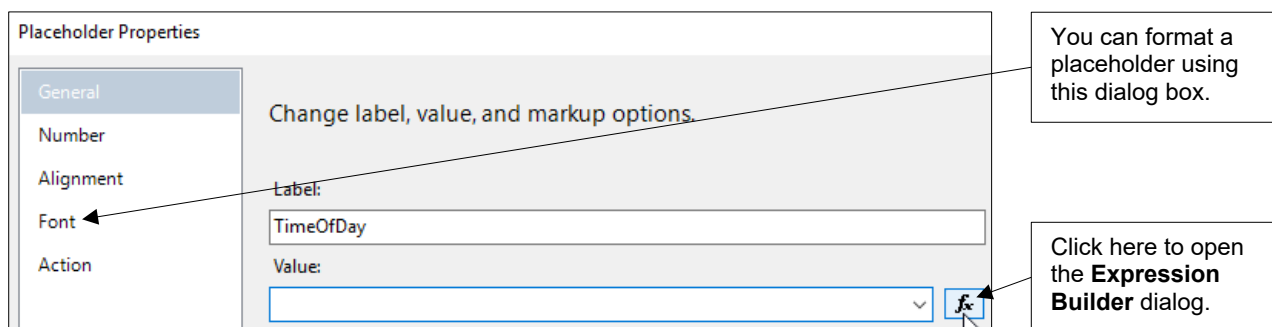

Creating a Placeholder

You can insert a placeholder into a textbox alongside any other text that you want to display. To do this:

- 1) Right-click inside the text box at the position you'd like to create your placeholder.

- 2) Enter a label which describes the placeholder and then use the button shown below to open the **Expression Builder**.

- 3) Create an expression to calculate the value of the placeholder.

- 4) Click **OK** twice to insert the placeholder into the text box.

When your report runs, the placeholder will be calculated and display the result.
