SQL Fast Track

Sample manual - first two chapters

Manual 1158 - 273 pages -

TABLE OF CONTENTS (1 of 9)

1	DESIGNING DATABASES	Page
1.1	The Four Stages of Database Design	11
	Stage 1 – Deciding what to Include	11
	Stage 2 – Dividing Data into Tables	12
	Stage 3 – Choosing a Primary Key for each Table	13
	Stage 4 – Creating Relationships and a Database Diagram	14
1.2	Many-to-Many Relationships	15

2	SQL SERVER MANAGEMENT STUDIO	Page
2.1	Starting to Use Management Studio	16
2.2	Object Explorer	17
	Useful Start-up Options	17

3	CREATING A DATABASE AND TABLES	Page
3.1	Creating the Database	18
	The Files Created	18
3.2	Creating Tables	19
3.3	Setting an Identity Primary Key	20
3.4	Creating Columns	21
	Data Types Explained in this Chapter Other Data Types in SQL Server	21 21
3.5	Whole Numbers	22
	Integer Field Types Logical Field Types	22 22
3.6	Other Numerical Fields	23
	Decimal and Numeric Field Types Float and Real Data Types	23 23
3.7	Character Data Types	24
	Types of Character Storage Variable Length Data Types Fixed Length Data Types	24 24 24
3.8	Date/Time Data Types	25
	Entering Dates into a Table	25
3.9	Default and Null Values	26
	Allowing Nulls Default Values	26 26
3.10	Database Diagrams	27
	Creating a Database Diagram Creating Relationships Database Diagram Support Objects Error	27 28 28

4	QUERIES	Page
4.1	Basic SELECT Statements	29
	Where to Put your Commas	29
4.2	Creating Queries	30
	Starting a New Query Choosing the Right Database	30 30
4.3	Running Queries	31
	Parsing a Query	31
	Executing a Query	31
	Viewing Information on a Query's Execution	32
	Cancelling a Running Query	32
	Redirecting Query Output	32
4.4	Dealing with Errors	33
	Displaying Line Numbers	33
4.5	Using IntelliSense	34
	Refreshing IntelliSense	34
4.6	Multiple SQL Commands	35
4.7	Saving, Opening and Closing Queries	36
	Saving Queries	36
	Opening Queries	36
	Closing Queries	37

5	LAYING OUT QUERIES	Page
5.1	Using Case	38
5.2	Indentation and Word Wrap	39
	Changing Tab Settings	39
	Word Wrap	39
5.3	Comments	40
	Commenting Out Blocks of Code	40
5.4	Colours in SQL	41
	Changing the Default Colours	41
5.5	Auto-formatting SQL	42

TABLE OF CONTENTS (2 of 9)

6	THE SELECT STATEMENT	Page
6.1	SELECT Statement Syntax	43
	Mnemonic for Order of Commands	43
6.2	Qualified Tables and Columns	44
	Dragging Tables/Columns onto a Query Specifying the DBO Schema and Database	44 44
6.3	Table Aliases	44
	Reason 1 for Aliases – Easier to Refer to Field Names	45
	Reason 2 for Aliases – Joins	46
	Changing a Table Alias	46
6.4	Column Aliases	47
	Basic Column Aliases	47
	Other Ways to Create Column Aliases Aliases in WHERE and ORDER BY Clauses	47 48
6.5	Ordering Rows	49
	Simple Sorting	49
	Sorting by Multiple Columns	49
6.6	Miscellaneous SELECT Tricks	50
	Selecting All Columns Using *	50
	Selecting Unique Rows	50
	Showing Top and Bottom Rows Including Ties	51 51
	-	• •
6.7	Using UNION to Combine Results	52

7 **QUERY DESIGNER** Page 7.1 Starting Query Designer 53 What Query Designer is and does 53 Starting Query Designer 53 7.2 Using Query Designer 54 Choosing Tables 54 Adding/Removing Tables 54 The Parts of Query Designer 55 The Non-Existent Results Pane/Execute 55 Button Working with Columns 56 Finishing Work in Query Designer 56 7.3 Editing Generated SQL 57 7.4 **Advanced Features** 58 Inner and Outer Joins 58 58 Grouping

8 **CRITERIA USING WHERE** Page 8.1 The WHERE Clause 59 **Relational Operators** 59 8.2 Criteria with Numbers 60 Using Comparisons 60 Finding Numbers in a Given Range 60 8.3 Criteria using Text 61 Exact Matches 61 Wildcard Matches using LIKE 61 Using Special Characters with LIKE 62 Ranges and Wildcards 62 Using Relational Operators with Text 63 Case Sensitivity 63 8.4 Criteria for Dates 64 Using Dates in Criteria 64 Using Dates with Wildcards 64 8.5 **Combining Criteria** 65 8.6 Nulls 66 An Example of Testing for Nulls 66 Entering Nulls into a Table 66

9	EXPORTING TO EXCEL	Page
9.1	Copying and Pasting	67
	Copying Column Headers by Default	67
9.2	Exporting Data	68
	Step 1 – Getting the Query	68
	Step 2 – Starting to Export Data	68
	Step 3 – Choosing the Source	68
	Step 4 – Choosing the Destination	69
	Step 5 – Specifying the Data to Export	70
	Step 6 – Specifying how to Export	70
	Step 7 – Finishing the Export	70

TABLE OF CONTENTS (3 of 9)

10	CALCULATIONS	Page
10.1	Creating Calculated Columns	72
	Giving Calculated Columns Aliases	72
	Using Column Aliases in ORDER BY Clauses	72
	Column Aliases Don't Work in WHERE Criteria	73
10.2	Using SQL Functions	74
	Typing an SQL Function Getting the Full List of Functions	74 74
10.3	Casting Data Types	75
	The Need for Casting	75
	Data Type Precedence	76
	The CAST Function The CONVERT Function	77 77
10.4	Numerical Calculations	78
10.1	Mathematical Symbols and BODMAS	78
	The Modulus Operator (%)	78
	Mathematical Functions	79
	The Importance of Casting Numbers for Calculations	80
	A Short-Cut to Forcing the Right Number Type	80
10.5	Text Calculations	81
	Concatenating Text using the CONCAT Function	81
	Concatenating Text Using the Plus Sign (with Data Conversion)	81
	Functions to Turn Numbers into Text	83
	Functions to Search for and Replace Text	83
	Functions for Extracting Text	84
	Changing the Case of Text Functions for Trimming Text	84 85
	Other Text Functions	85
	Worked Example – 1	86
	Worked Example – 2	86
	3	86
10.6	Dealing with Nulls	87
	The ISNULL Function	87
	The COALESCE Function	88
10.7	Testing Conditions using IIF	89

11	THE CASE EXPRESSION	Page
11.1	The Searched Case Expression	90
	Example: Film Bands Example: Film Era Using CASE in WHERE Criteria	90 91 91
11.2	The Simple Case Statement	92
11.3	Nested CASE Statements	93

12	DATE CALCULATIONS	Page
12.1	How Dates and Times Work	94
	How SQL Server Stores Dates and Times	94
	Displaying Dates/Times	94
	GETDATE – the Current Date/Time	95
	Dates Prefer American Format	95
12.2	Formatting Dates using FORMAT	96
	The Available Codes	96
	Using the Culture Argument	97
	How Slow is the Format Function?	97
12.3	Formatting Dates using CONVERT	98
12.4	Parts of a Date: DATEPART and DATENAME	99
	Displaying a Day Suffix	100
12.5	Getting the Difference between Dates	100
	Subtracting One Date from Another	101
	The DATEDIFF Function	101
12.6	Calculating Ages Correctly	102
	Using DateDiff	102
	Dividing Someone's Age in Days by 365	102
	Getting the Exact Age	103
12.7	Adding Dates using DATEADD	104

TABLE OF CONTENTS (4 of 9)

13	JOINS	Page
13.1	Overview of Joins	105
	What is a Join? The Types of Join	105 105
13.2	Understanding your Database	106
	How Relationships Work (Reminder)	106
13.3	Easy Joins, using Query Designer	107
13.4	Inner Joins	108
	The Syntax of an Inner Join Our Example – Joining the Film and Director Tables Joining more than One Table Variations on Inner Join Syntax Composite Joins Joining by Expressions	108 108 109 109 110 110
13.5	Outer Joins	112
	Outer Joins using Query Designer Outer Joins in SQL Left and Right Outer Joins Picking Out Unmatched Rows Full Outer Joins	112 113 113 114 114
13.6	Cross Joins	115
	A Practical Example of Cross Joins	115
13.7	Self-Joins	116

14	SUMMARISING DATA	Page
14.1	Simple Summarising	117
	Syntax of a Simple Summary	117
14.2	Counting	118
	Counting All of a Table's Rows Counting Non-Null Columns Counting Unique Values	118 118 119
14.3	Grouping	120
	Why you Need GROUP BY The GROUP BY Clause Grouping by Multiple Columns Grouping by Expressions Grouping without Aggregating	120 120 121 121 122
14.4	Filtering Results using HAVING	123
14.5	Casting Data for (eg) Averages	124
14.6	Dealing with Nulls	125
	The Default Treatment of Nulls Forcing SQL to Include Nulls	125 125
14.7	Additional Options when Grouping	126
	Using ALL to Show Missing Rows Using CUBE to Show All Combinations Using GROUPING to Show Levels	126 126 127

15 VIEWS Page 15.1 Why Views are Useful 128 Use 1: Pre-Joining Tables 128 Use 2: Virtually Renaming Columns 129 15.2 Views using the Designer 130 Starting the Designer 130 Choosing Columns 130 Sorting and Filtering 131 Adding Grouping 131 Executing a View 132 Saving and Closing Views 133 Seeing your View in Object Explorer 133 Running a View 134 Changing a View 134 15.3 Scripting Views 135 Creating a New View 135 Changing an Open View in Script 136 Changing a View's Script from Object 136 Explorer 15.4 Switching between the Designer and 137 Scripting

TABLE OF CONTENTS (5 of 9)

16	CTES AND DERIVED TABLES	Page
16.1	Multi-Stage Queries	138
16.2	Derived Tables	139
16.3	Single CTEs (Common Table Expressions)	140
	Syntax of Single CTEs The CTE for our Example	140 140
16.4	Multiple CTEs	141
	Syntax of Multiple CTEs Example of a Multiple CTE	141 142

17	SUBQUERIES	Page
17.1	Single-Value Subqueries	143
	Example: Showing the Name of the Longest Film	143
17.2	ANY, ALL, IN and NOT IN	144
17.3	Correlated Subqueries	145
	Correlated Subqueries: Definition and Example	145
	Alternatives to Correlated Subqueries	145
	Considering Speed	146
	Using EXISTS to Check whether Rows are Returned	146

18	RANKING AND PERCENTILES	Page
18.1	Ranking and Numbering	147
	Simple Row Numbering	147
18.2	Leading and Lagging	148
	Example of LAG: Actors Born One Week Apart	148
18.3	Percentiles	149
	Percentile Rankings	149

19	STORED PROCEDURES	Page
19.1	Overview	150
	What is a Stored Procedure? Advantages and Disadvantages	150 150
19.2	Creating Stored Procedures	151
	Typing in a Stored Procedure Creating a Stored Procedure using a Template Executing the Query to Create your Stored Procedure	151 151 152
	Viewing your Stored Procedure	152
19.3	Altering a Stored Procedure	153
	Altering an Open Stored Procedure Altering a Procedure in a Database	153 153
19.4	Executing Stored Procedures	154
	Refreshing your Local Cache Executing a Procedure Altering and Executing a Stored Procedure Together Selecting a Stored Procedure Name to	154 154 155 155
	Run It	
19.5	Renaming and Deleting Stored Procedures	156
	Renaming/Deleting a Procedure with the Menu	156
	Deleting a Procedure in Script Renaming a Procedure in Script	156 156
19.6	System Stored Procedures	157
	Listing System Stored Procedures Useful System Stored Procedures	157 158
19.7	Getting Help on SQL	159
	Context-Sensitive Help Tips on Googling	159 159

TABLE OF CONTENTS (6 of 9)

20	VARIABLES	Page
20.1	Declaring Variables	160
	Syntax for Declaring a Variable	160
20.2	Using Variables	161
	Setting the Value of a Variable Showing the Values of Variables Scope of Variables Incrementing and Concatenating Variables The Importance of Casting	161 161 162 162 163
20.3	Using Variables with Subqueries	164
	An Alternative Approach: Aggregate Functions	164
20.4	Storing Column Values in Variables	165
	Storing a Single Row's Values Accumulating Numbers Accumulating Text	165 165 166
20.5	Global Variables	167
	Special Considerations when using @@ROWCOUNT	167

21	VARIABLE AND PARAMETER DATA TYPES	Page
21.1	Numeric Data Types	168
	Integer Variable/Parameter Types Decimal and Numeric Types	168 168
21.2	Character Data Types	169
	Types of Character Storage Variable Length Data Types Fixed Length Data Types	169 169 169
21.3	Date/Time Data Types	170

22	STORED PROCEDURE PARAMETERS	Page
22.1	Overview	171
	Syntax of Parameters	171
22.2	Simple Parameters	172
	Step 1 – Specifying the Parameters	172
	Step 2 – Coding the Parameters	172
	Step 3 – Referencing the Parameters	173
	Using Text Wildcards as Parameters	173
22.3	Running Procedures using Parameters	174
	Positional Arguments	174
	Named Arguments	175
	Right-clicking to Execute a Procedure	175
22.4	Default Parameter Values	176
	Setting Default Values to Null	177
	The Perfect Stored Procedure?	177
22.5	The RETURN Statement	178
22.6	Output Parameters	179

23	CONDITIONS AND LOOPS	Page
23.1	IF Conditions	180
	Simple Conditions	180
	Using BEGIN END	180
	Using ELSE	181
	Nesting Conditions and Indentation	181
	Using CASE to Avoid IF	182

38.5	Optimising Queries	269
38.6	Debugging SQL	270

CHAPTER 1 - DESIGNING DATABASES

The world runs on relational databases. If you understand the principles upon which these are built, you'll find it much easier to write SQL to get information out of them!

This manual gives an overview only of database design principles. If you want to delve deeper, try Googling phrases like **Third Normal Form**, **Database Normalisation** or **Entity Diagram**. If nothing else, this will give you an impressive search history in your browser!

1.1 The Four Stages of Database Design

There are four stages to designing a relational database, shown below (using the example of creating a simple database to hold films; or movies, if you must).

Stage 1 – Deciding what to Include

A good way to do this is to create a spreadsheet of the data you want to include for each film:

Title	Oscars	Director	Date of birth	Studio
Armageddon	0	Michael Bay	17/02/1965	Touchstone Pictures
Bad Boys	0	Michael Bay	17/02/1965	Jerry Bruckheimer Films
Bad Boys II	0	Michael Bay	17/02/1965	Jerry Bruckheimer Films
Dead Poets Society	1	Peter Weir	21/08/1944	Touchstone Pictures
Master and Commander	2	Peter Weir	21/08/1944	20th Century Fox
Pearl Harbor	1	Michael Bay	17/02/1965	Touchstone Pictures
The Rock	0	Michael Bay	17/02/1965	Hollywood Pictures
The Truman Show	0	Peter Weir	21/08/1944	Scott Rudin Productions

We want to assign each film to a director, but we don't want to have to type each director's name in over and over again!

The aim of designing a relational database is to ensure that you don't hold information twice:

Title	Oscars	Director
Dead Poets Society	1	Peter Weir
Master and Commander	2	Peter Wier 🔺
The Truman Show	0	Peter Weird

Not only is holding duplicate information inefficient, but it also means that spelling mistakes will creep in. Here listing out films directed by **Peter Weir** would miss out the last two films, as his name has been misspelt.

Stage 2 – Dividing Data into Tables

Having decided what data you want to include, the next stage of database design is to decide which table each bit of information belongs to:

Title	Oscars	Director	Date of birth	Studio
Armageddon	0	Michael Bay	17/02/1965	Touchstone Pictures
Bad Boys	0	Michael Bay	17/02/1965	Jerry Bruckheimer Films
Bad Boys II	0	Michael Bay	17/02/1965	Jerry Bruckheimer Films
Dead Poets Society	1	Peter Weir	21/08/1944	Touchstone Pictures
Master and Commander	2	Peter Weir	21/08/1944	20th Century Fox
Pearl Harbor	1	Michael Bay	17/02/1965	Touchstone Pictures
The Rock	0	Michael Bay	17/02/1965	Hollywood Pictures
The Truman Show	0	Peter Weir	21/08/1944	Scott Rudin Productions
_			•	
These are all details to do with film itself.	the	These are to de director (name		These are details to do with the studio.

There's no magic wand to make this easier, other than bitter experience of getting it wrong and having to start again! A good guideline is that if you find yourself typing in something twice, it probably belonged in a different table.

For our example above, there are clearly 3 separate entities: films, the directors who made them and the studios which produced them. Here are the fields that each table could contain:

Table	Fields
Film	Title and Oscars Won, plus something to identify which director and which studio made it
Director	Director name and Date of birth, plus some unique identifier for the director
Studio	Studio name, plus some unique identifier for the studio

What you need to do next is to decide what form these unique identifiers should take.

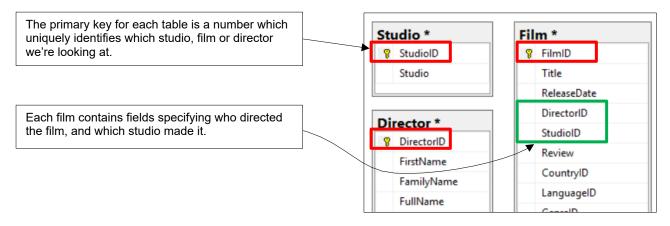

Stage 3 – Choosing a Primary Key for each Table

The *primary key* for a table is a field which tells you exactly which record you're considering (for example, if you know a film's **DirectorID** you can look up all of the director's other details).

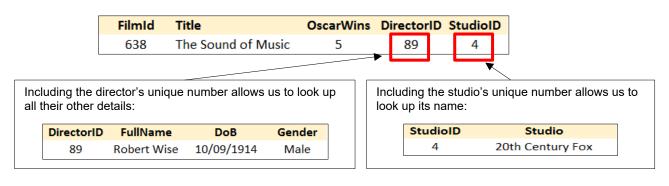

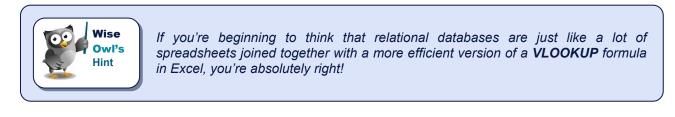

From the above definition, it follows that two records in a table can't have the same value for the primary key field – the field is unique.

For our example, we could use the director and studio names as our primary keys, but SQL Server works most efficiently if the primary key is as short as possible, so we'll create new fields instead:

Here's what The Sound of Music would now look like:

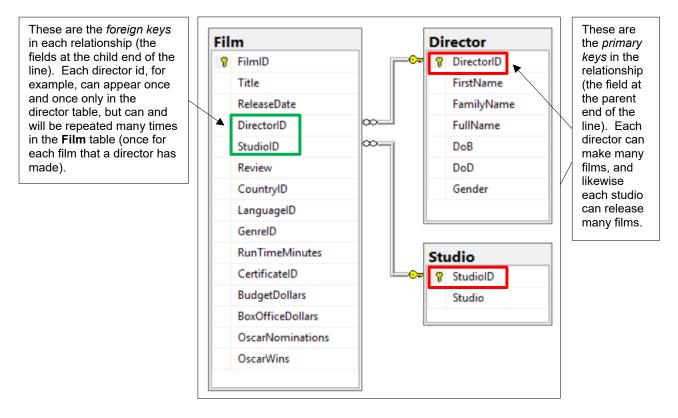

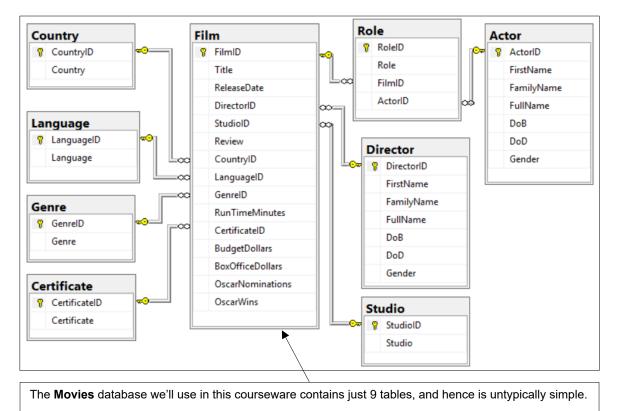

Stage 4 – Creating Relationships and a Database Diagram

The last step in designing a database is to decide for each relationship that you create whether it is *one-to-many* or *many-to-one* (*parent-child* or *child-parent*):

Database diagrams often involve hundreds of tables:

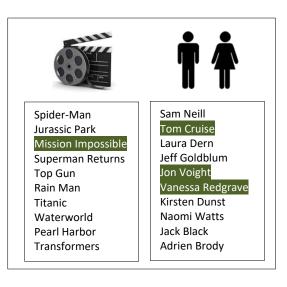

1.2 Many-to-Many Relationships

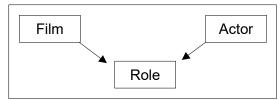

There's no such thing as a many-to-many relationship in SQL Server, but they do exist in real life:

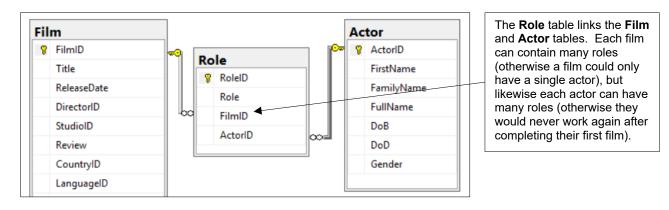

Tom Cruise has appeared in lots of films, but equally Mission: Impossible has lots of actors in it.

The solution to this problem is to create a table that is a child to both of the two parent tables, as here:

Here's what the database would look like:

Here are 3 rows from the Role table:

						1	Ray Ferrier	33	1
	_				_	2	Dr. Alan Grant	1	2
Here are the films		Film number 1 appears twice in			3	Dr. Ellie Sattle	r 1	3	
and actors who are represented by these rows of data (the RoleID Role		st, as does actor nu	ctor number 1.		202	Nathan Algren	41	1	
		RoleID	Role	FilmID	Act	orID	Title		FullName
duplicate film name was Jurassic Park , and duplicated actor turns out to be Tom Cruise).		1	Ray Ferrier	33	1		War of the Worlds		Tom Cruise
		2	Dr. Alan Grant	1	2		Jurassic Park		Sam Neil
		3	Dr. Ellie Sattler	1	3		Jurassic Park		Laura Der
		202	Nathan Algren	41	1		The Last Samurai		Tom Cruise

CHAPTER 2 - SQL SERVER MANAGEMENT STUDIO

If you're writing SQL to get information out of a database created using SQL Server, the chances are that you'll use *SSMS* (*SQL Server Management Studio*) as your authoring tool.

2.1 Starting to Use Management Studio

You can start SSMS like any other application – here are a couple of ways using Windows 10:

	Microsoft SQL Server	2016 ^	Apps
	Depl Microsoft SQL	. Server Manage	🧏 SQL Server Management Studio
8	Microsoft SQL Serve	r Manageme	🧏 Microsoft SQL Server Management Studio
			🐷 Print Management
ļ	Reporting Services C	Configuration	🔹 Computer Managem ent
S.	Resource Center		Settings >
ŝ	SQL Server 2016 Dat	ta Feed Publi	3 Color Management
Ċ			🕅 🗄 Create and format hard disk partitions
	SQL Server 2016 Dat	~	Connect to work or school
	∧ □ <u>≥</u>		managem
1			🖬 🔎 🗔 📓 🗐 🚺
Click on	the Windows icon, and		▶
	the program that you want		and type in part of the program name (here typing enough to bring up the program name in the list).

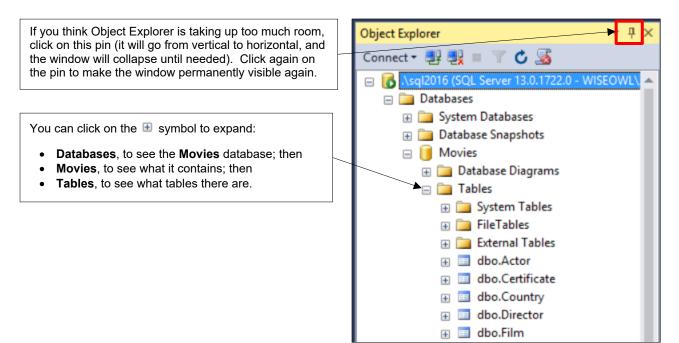

You can then choose a database to use (or *connect to*):

You will see the SQL Server logo on screen while it loads:	J Connect to Server		×
SQL Server 2016		SQL Server	
Management Studio	Server type:	Database Engine	~
Prevent by Visual Radio	Server name:	.\sql2016	~
	Authentication:	Windows Authentication	~
You can then choose from the dropdown list which of your	User name:	WISEOWL\Andy.Brown	~
company's servers you want to connect to (your IT people should be	Password:		
able to advise on which to choose).		Remember password	
If you use Windows authentication, you won't have to type in any more			
user names or passwords.		Connect Cancel Help	Options >>

2.2 Object Explorer

When Management Studio loads, you should see the **Object Explorer** window (if it's not visible, press F8 to show it):

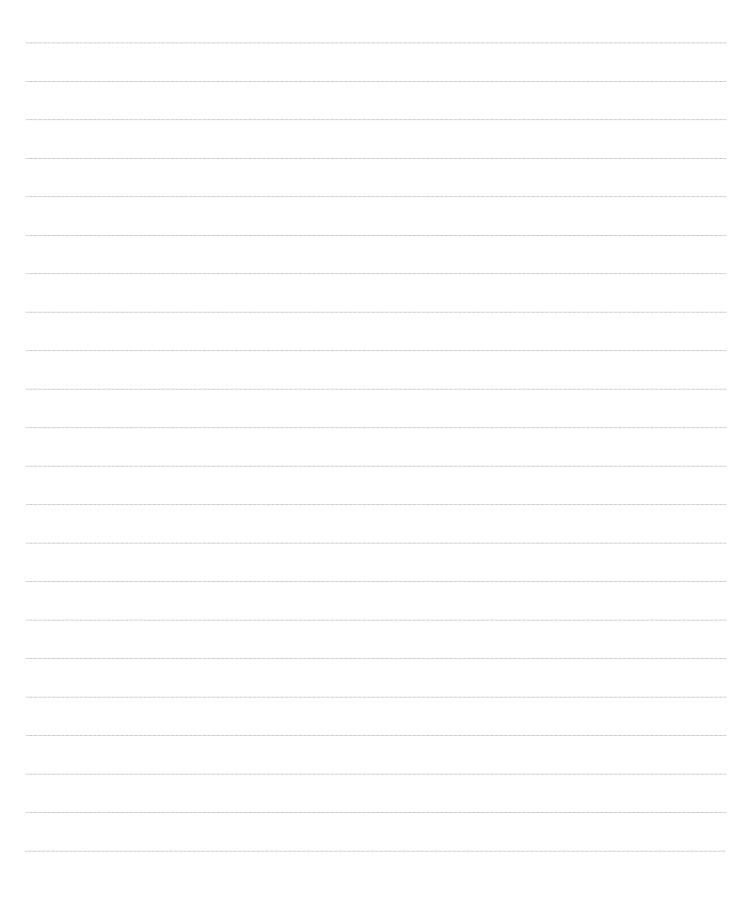

Useful Start-up Options

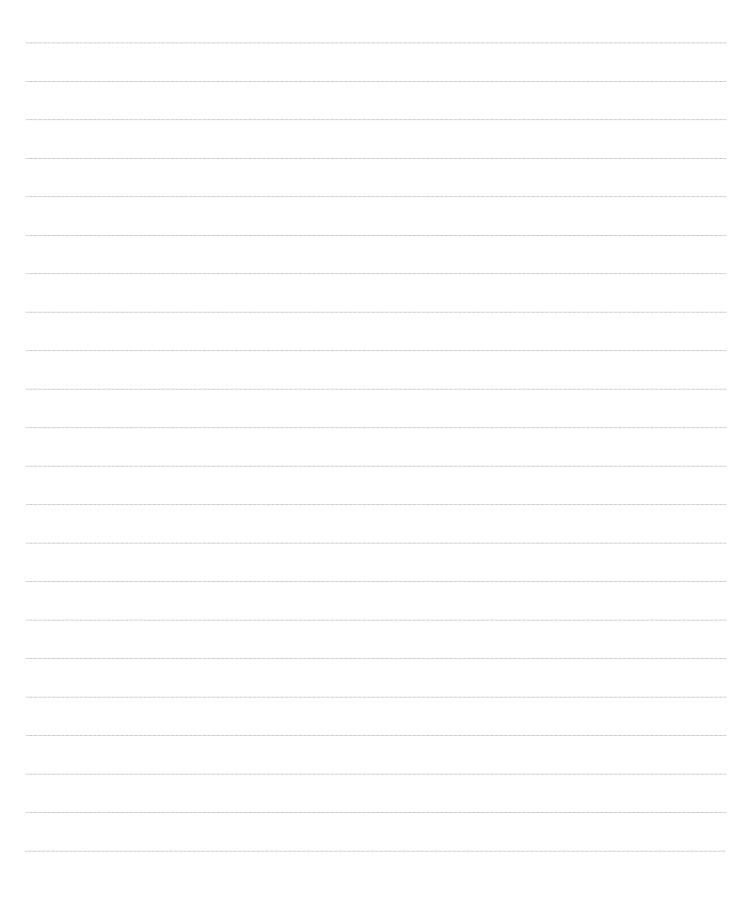

You can control what happens when you start Management Studio. To do this, from the menu select **Tools** \rightarrow **Options**, then complete the dialog box which appears as follows:

Search Options (Ctrl+E)	<u>A</u> t startup:	
 ✓ Environment General AutoRecover Documents Find and Replace Fonts and Colors Import and Export Settings International Settings ▷ Keyboard Quick Launch Startup Tabs and Windows ▷ Text Editor 	Open Object Explorer	
a) System objects clutter up SQL Server, and (in this owl's opinion) are best hidden, although you won't see a huge amount of difference.	b) You can click on the drop arrow and choose (for example) to show a blank query as well as Object Explorer whenever you open Management Studio.	At startup: Open Object Explorer Open Object Explorer Open Object Explorer and query window Open Object Explorer and Activity Monitor Open Object Explorer and Activity Monitor

What we do!
